TECHNICAL BULLETIN Annual and Semi-Annual Inspections

July 11, 2005

Document FLTB05-07-2

Dear Business Leader:

During annual or semi-annual inspections, system failures are sometimes identified. Over time, electronic components can fail due to aging, the breakdown of materials or environmental conditions. Some components may fail sooner than others. While our Engineering Department makes every attempt to supervise the critical circuit parts of our products, not all components may be supervised. UL sets a standard for unsupervised parts and our systems are designed to exceed the standard.

For example, testing NAC circuits per NFPA 72 standards is critical to ensure component or module failures are found and repaired or replaced as necessary. Since NFPA requires frequent testing of entire systems, we encourage all FireLite customers to reconfirm to their end user customers the importance of for annual and semi-annual testing. Most municipalities require this testing and this practice may uncover potential non-performing operations.

Sincerely,

A handwritten signature in black ink that reads "Nick Martello".

Nick Martello
FireLite Marketing Director
